A Social Trends Report

Gambling: As the Take Rises, So Does Public Concern

A modest backlash in attitudes towards legalized gambling has taken hold among an American public that spends more money on more forms of legal gambling now than at any time in the nation's history.

Seven-in-ten (70%) Americans say that legalized gambling encourages people to gamble more than they can afford, according to a new Pew Research Center survey. By contrast, 62% expressed that concern in 1989 when the same question was posed in a Gallup survey.

Similarly, 71% of the public today—down from 78% in 1989—approves of lotteries as a way for states to raise revenue. Public support for other forms of legalized gambling, such as casino, off-track betting on horse racing and pro sports betting, has either been stable or declined since 1989.

These findings come at a time when gambling has become more pervasive in the popular culture, with a record number of casinos operating across the country, with online gambling gaining fast in popularity (albeit from a small base), with several celebrities going public with their gambling problems and exploits, and with poker tournaments having become a new form of television entertainment.

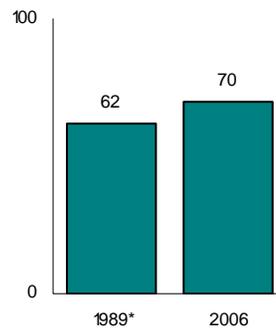

Despite all this, the survey finds that fewer people now (23%) than in 1989 (34%) say that they enjoy making bets; it also finds a decline, compared with 1989, in the overall percentage of people who report that they made a bet of any kind in the past year. Betting on horse racing and pro sports, in particular, has dropped off.

However, the survey also finds a sharp increase since 1989 in some high profile forms of betting – including casino gambling and slot machines.

These findings line up with industry reports that show that these forms of gambling have been in a period of rapid growth.

Some key industry indicators and estimates:

- In 2005, according to industry estimates, 890 casinos (including commercial, tribal and racetrack) across the country took in more than \$52 billion in gross revenues. Commercial casinos, alone, have nearly doubled their take over the past decade.¹
- In 2005, lotteries in a total of 41 states sold a record \$52 billion in tickets. In 1989, just 32 states had lotteries, which sold \$19 billion in tickets. In 2004, per capita sales figures, averaged across all states with a lottery, were estimated at \$184.²

- By at least one estimate, Americans spent more than \$33 billion on slot machines in casinos in 2005, a figure that does not include revenues from the growing number of slot machines located in other venues.³
- Internet gambling is the fastest-growing segment of the gambling market. Media sources estimate that \$13 billion was wagered online last year in the United States (where internet gambling occupies a legal gray area) and throughout the world.⁴

The Pew telephone survey was conducted from Feb. 8 through March 7, 2006 among a nationally representative, randomly selected sample of 2,250 adults.

Among its key findings:

- The negative turn in attitudes toward gambling appears to be driven by concerns that people are gambling too much rather than by any revival of the once common view that gambling is immoral. In the Pew survey, 28% of respondents say they believe gambling is immoral. In a similar 1990 survey by the *Star Tribune*, 32% of Americans said they considered gambling immoral.
- Two-thirds (67%) of respondents in the Pew survey say they placed a bet on one thing or another in the past year, down modestly from 71% who said the same in the 1989 Gallup survey. While many forms of gambling have declined in popularity (including betting on horse and dog races, as well as on boxing and professional and college team sports), other forms—casino gambling and slot machines—have grown more popular. Also some 2% of the public reports having gambled online in the past year; this form of wagering did not exist in 1989.

⁴ *Online gaming lures new players; overall market grows*. Marketwatch.com April 28, 2006, updated May 1, 2006.

- Nearly three-in-ten (29%) Americans report having gone to a casino in the past year, up from 20% who said they did this in 1989. Also, those who go to casinos are going more frequently. More than a third (36%) of self-reported casino-goers in the Pew survey say they had visited a casino at least “once every few months” in the past year. In 1989, about a quarter (26%) of casino goers said they had visited a casino at least “once every few months” in the past year.
- The public has mixed views about whether or not casinos are good for local communities. A plurality (42%) of adults say casinos have a negative impact on their communities, while about a third (34%) say they have a positive impact. The rest say both, neither or that they don’t know. Those who report living near a casino are nearly evenly divided about the impact of casinos on the local community (40% positive; 38% negative).
- While more adults now than in 1989 say legalized gambling encourages people to gamble more than they can afford, there has not been a similar rise in the number of survey respondents who say they themselves have a gambling problem. Some 7% of all respondents (and 9% of all respondents who report that they’ve gambled in the past year) say they themselves have sometimes gambled more than they can afford. Some 6% say gambling has been a source of problems within their own family.
- Most gamblers (56%) say they’re behind for the year; three-in-ten say they’re ahead for the year.
- There’s a striking difference by age in these self-reports of gambling wins and losses. Half (49%) of all 18-to-29 year old gamblers say they’re ahead for the year; this is more than double the percentage of all gamblers ages 65 and over who say they’re ahead for the year (23%). Apparently the young have twice as much of something—be it luck, skill, braggadocio or self-delusion.
- Even though gamblers as a group say they lose more than they win, their good days appear to be very good while their bad days are only moderately bad. When asked to report the most money they ever won or lost in a single day, the average best-day win reported by gamblers in our survey say was \$1,049—and the average worst-day loss was \$492.
- Seven-in-ten gamblers (71%) say they gamble mostly for enjoyment, while two-in-ten (21%) say they gamble mostly to make money. And enjoyment is what they get—when they win. Nearly nine-in-ten (87%) gamblers say they feel at least somewhat satisfied when they win, while just four-in-ten say they feel at least somewhat upset when they lose.

I. Gambling Behaviors

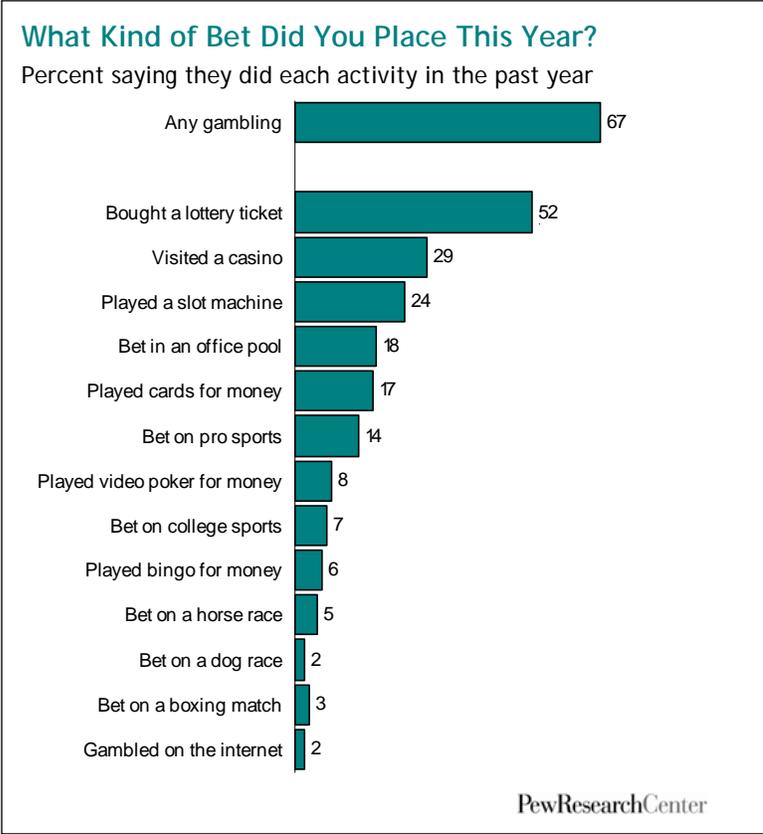

Patterns of gambling behavior are changing; many forms of legal betting have lost favor with the public since 1989, while a few of the most high-profile kinds of gambling (casinos and slots) have become more popular. Overall, about two-thirds (67%) of the adult population say they placed a bet of some kind in the past year, down slightly from the 71% who reported doing so back in 1989.

This year as in 1989, playing a state lottery is by far the most common form of gambling. Slightly more than half (52%) of all adults in the country say they bought a lottery ticket in the past year. The next most common form of gambling is visiting a casino – something that about three-in-ten adults (29%) say they did in the past year. Following that is playing a slot machine (24%), which is most typically done in casinos but which now is also pursued in other venues, such as race tracks. (According to one media report, there are now about 740,000 slot machines in casinos and other venues around the country).⁵

*Source: Gallup, April 1989
PewResearchCenter

⁵ Cooper, Marc. Sit and spin: How slot machines give gamblers the business. *The Atlantic Monthly*, December 2005.

There has been a drop in gambling across many of the 10 forms of gambling considered in both the Gallup 1989 and Pew surveys, including betting on pro sports (14% do so now, down from 22% in 1989); horse racing (5% now, down from 14% in 1989) and bingo (6% now, down from 13% in 1989). Much of this drop off occurred in the 1990's; the trends have been more stable since then.

The biggest increases since 1989 have been among those who go to casinos and play slots. As for internet gambling, which has only come into prominence in recent years, the Pew survey finds that 2% of the public placed bets online last year, up from 1% when this form of gambling was first measured by a Gallup survey in 1996.

The modest decline in gambling behavior overall tracks with a downward trend in reported enjoyment from making bets. Today fewer than a quarter (23%) of adults say they enjoy making bets of any kind “a lot” or “a little”; by contrast more than a third (34%) said this back in 1989.

This decline in enjoyment of gambling since 1989 holds true for all major demographic groups.

It also holds true for those who have gambled in the past year. A third of gamblers say they enjoy making bets a lot or a little, down from 46% of gamblers who said this in 1989.

PewResearchCenter

Profile of the Players

Despite the drop off, most people in this country still gamble, and about two-thirds (67%) say they did so within the past year. Who are the gamblers? While the patterns vary somewhat across forms of gambling, men are more likely than women to do any kind of gambling; those under 65 are more likely than those 65 and older; and the affluent are more likely than those with less income. Also, whites are somewhat more inclined to gamble than are blacks or Hispanics.

There isn't much variance in the likelihood to gamble by differing levels of education, but there is some variance by region of the country. People who live in the Northeast are more likely to gamble than are those in any other region of the country – mostly because Northeasterners play their state lotteries more often. More westerners, in turn, visit casinos than do people elsewhere in the country.

White evangelical Protestants are less likely to have gambled in the past year than are Catholics or white mainline Protestants. This is especially true for white evangelical Protestants who attend church services frequently.

Gamblers Portray Themselves As Content Losers

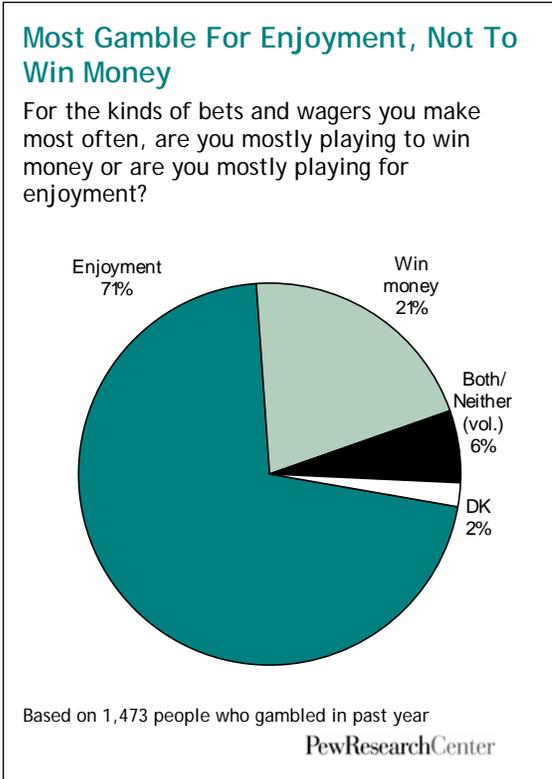

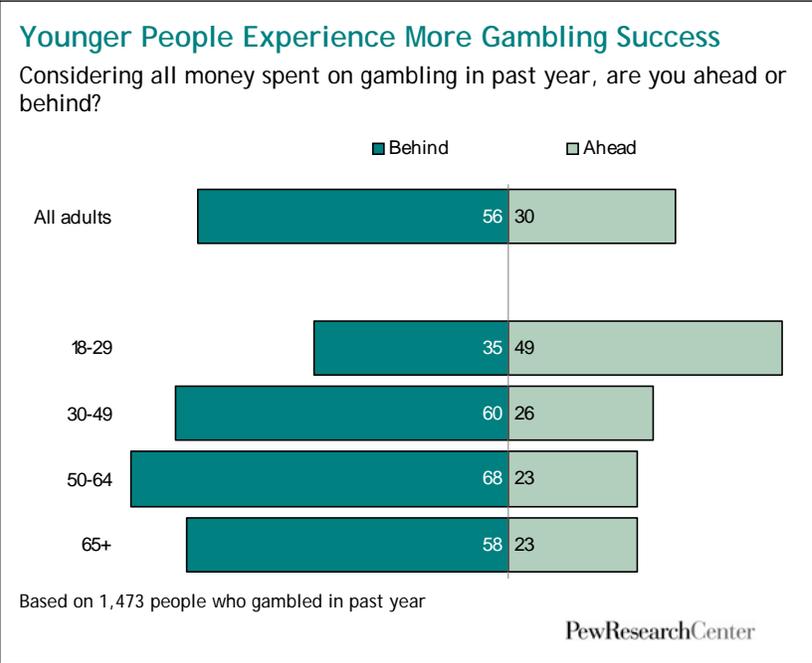

When asked to think about all their bets in the past year, many more gamblers say they're behind (56%) than ahead (30%). This self-reported negative win-loss ratio is slightly better now than it was in 1989, when Gallup asked the same question. Back then, 58% said they were behind for the year and 24% said they were ahead.

The only demographic group of gamblers who seem immune to lousy cards and bad rolls of the dice are the young. Among 18-to-29 year old gamblers, about half

say they are ahead for the year (49%) while just over a third (35%) say they're behind. But for all age groups older than that, lady luck runs the other way. By a margin of better than two-to-one, they said they're behind for the year. Go figure.

Why do gamblers keep playing if most of them lose most of the time? Simple, they like the action. Some seven-in-ten gamblers (71%) say they gamble mostly for enjoyment, while two-in-ten (21%) say they gamble mostly to make money.

Even though making money is the lesser motivation for all groups, some groups are a bit more inclined than others to cite it as a reason for gambling. For example, more blacks (34%) than whites (19%) cite winning money as the main reason they gamble. So do more people with low rather than high income.

But enjoyment is what most people want from gambling – and enjoyment is what most people get when they win. The gamblers in our survey are much more likely to say they’re pleased by winning than to say they’re upset by losing.

Just over half of the gamblers say they are either extremely (21%) or very satisfied (30%) when they win; while fewer than one-in-twelve say they are either extremely or very upset when they lose. These ratios are basically unchanged since 1989.

Satisfaction with winning is especially sharp among the young (64% of 18-29 years old say they’re extremely or very satisfied when they win); among card players (66% are extremely or very satisfied when they win) and among those who say they gamble more than they should (71% are extremely or very satisfied when they win).

Even though few gamblers say they get extremely (3%) or very upset (5%) when they lose, within this small universe, some groups are better represented than others.

More blacks (15%) than whites (8%) or Hispanics (7%) say they get extremely or very upset when they lose. Men (10%) are a bit more likely to say this than women (6%); gamblers under age 30 (12%) say this more than their elders (7% for those ages 30 to 49; 9% for 50 to 64; 7% for those ages 65 and older). Also, those who say they gamble more than they should are more likely to report being extremely or very upset when they lose (28%) than are other gamblers (7%).

Some of Gamblers' Self-Reports Do Not Add Up

The average gambler in our survey reports winning \$1,049 on his or her best single day of betting—and losing \$492 on his or her worst day. Both of these figures are skewed upward by a small percentage of people who report very heavy single-day wins and losses. The median figure for gamblers' best day of winnings (that is, the point at which half of the sample reports a larger number for the best day of winnings and half the sample reports a smaller number) is \$100; and the median figure for the worst day of losses is \$25.

No matter how one analyzes these data, however – by median or by mean – these self-reports from all gamblers about their best and worst days would seem to be out of sync with their self-reports about their yearly tally (by a ratio of nearly two-to-one, gamblers report they are behind rather than ahead for the year). There are at least two possible explanations. Either most gamblers occasionally win big sums and frequently lose small sums, or, human memory being what it is, best days stand out more vividly than worst days.

The groups that report the biggest average single day winnings include men (\$1,536 mean compared with \$537 for women); people with incomes above \$100,000 (\$2,112 mean compared with \$597 among those with incomes under \$30,000).

The groups that report the biggest single day losses include those who say they gamble more than they should (\$2,754 mean compared with \$250 among other gamblers); men (\$821 mean compared with \$143 for women); those with incomes of \$100,000 or more (\$497 mean compared with \$325 for those with incomes under \$30,000).

Asked how much they had bet in the past year compared with previous years, just 10% of gamblers said they had bet more, while 35% said they had bet less and 53% said about the same. These percentages were similar back in 1989. In both years, however, as in all years in between, there has been a steady increase in gross gambling revenues, according to casino industry reports.⁶

Problem Gambling: Not in My Backyard

Even though there's been a rise in the number of people who worry that legal gambling encourages people to gamble more than they should (70% say this now versus 62% in 1989), there has been virtually no change in the percentage of gamblers who say they themselves gamble too much.

Just 9% of gamblers say they sometimes gamble more than they should. This figure is basically unchanged since 1989.

Similarly, when respondents (whether or not they gamble) were asked whether gambling has ever been a source of problems within their family, just 6% said that it has. This figure is up slightly since 1989 (when it was 4%), but down slightly from 1999, when it was 9%.

Blacks are more likely than whites to say that they sometimes gamble more than they should and also to say that gambling has been a source of problems in their family. Some 19% of black gamblers say the former and some 12% of all black adults say the latter. The comparable figures for whites are 8% and 5%, respectively.

Adults under 50 (12%) are a bit more likely to report gambling too much compared with those ages 50 and older (5%); men (11%) say this more than women (8%); and the less affluent (14% among those with incomes under \$30,000) say this more than the affluent (5% among those with incomes of \$100,000 or more).

II. Attitudes About Gambling

“Over the past 50 years,” a commentator recently wrote, “gambling has gone from sin to vice to guilty pleasure and has come, finally, to be simply another point of interest on the entertainment map.”⁷

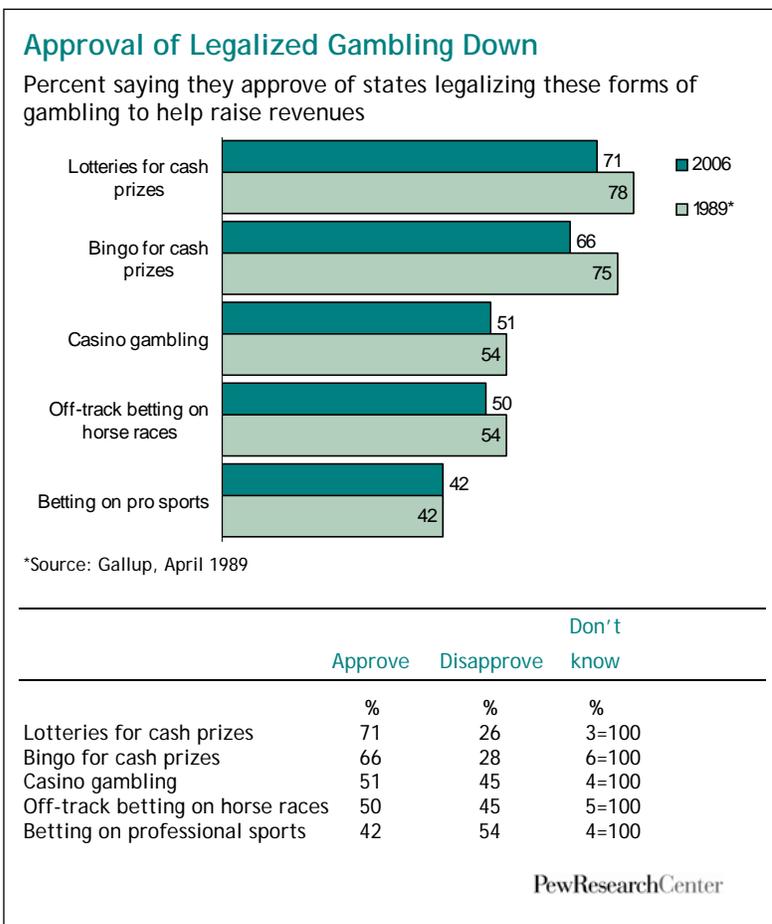

Whatever the accuracy of that observation as it relates to past attitudes toward gambling, it’s certainly true that today a majority of people approve of most forms of legalized gambling. And it’s also true that only a minority of Americans—28% in the Pew survey—now say that it is morally wrong to gamble.

At the same time, however, approval of legal gambling has trended downward a bit since 1989, as Americans increasingly see a downside to legalized gambling.

In general, attitudes about gambling are strongly correlated with one’s own gambling behavior; with one’s experience with problem gambling in the family, and with one’s level of religious observance. Not surprisingly, gamblers are more supportive of legalized gambling than are non-gamblers. Those who report that gambling has been a source of problems within their families are less supportive of legalized gambling. And, although a majority of Americans reject the idea that gambling is morally wrong, religion plays a role in support for gambling. Frequent church-attenders are less supportive of legalized gambling than are those who go to church less often; this pattern mimics the correlation between self-professed religious importance and attitudes toward gambling in the 1989 Gallup survey. The inverse relationship between attending religious services and support for legalized gambling is especially strong among white evangelical Protestants.

Approval of Legalized Gambling

Approval of legalized gambling has fallen from 1989 to 2006 for some types of gambling (including lotteries and bingo for cash prizes) and remained stable or dropped slightly for the other three types of gambling considered in the surveys taken in

⁷ Last, Jonathan V. Taste: Not just for losers anymore. *The Wall Street Journal*, October 21, 2005. Reprinted as Losers’ Poker, *The Weekly Standard*, October 21, 2005.

both years (casino gambling, off-track betting on horse races, and betting on pro sports). The drop in approval for lotteries and bingo for cash prizes occurred across all major demographic groups.

Among the forms of gambling considered in both surveys, betting on pro sports is the only one that fails to draw support from a majority of the public; just 42% say they approve of it, the same figure as in 1989.

Not surprisingly, people who follow sports very closely tilt the other way—a majority (55%) approve of legalized betting on professional sports, while 43% disapprove.

PewResearchCenter

But Is it Moral?

About two-thirds of adults (65%) reject the notion that gambling is morally wrong, while 28% endorse this point of view. This is about the same ratio as found in a 1990 national survey on gambling by the *Star Tribune* (65% to 32%).

The groups most likely to take the view that gambling is morally wrong include women, older adults (ages 65 and over), the less educated, and the less affluent. White evangelical Protestants are more likely than mainline Protestants to say that gambling is morally wrong; about half (49%) of white evangelical Protestants believe gambling is morally wrong, compared with 20% of white mainline Protestants, and 19% of Catholics. Those who attend religious services more frequently, regardless of religious tradition, are also more likely than less frequent church-goers to say that gambling is morally wrong.

Gambling More Than You Can Afford

Seven-in-ten (70%) Americans say that legalized gambling encourages people to gamble more than they can afford, up 8 points from the Gallup survey conducted in 1989. The view that legalized gambling encourages overspending is up among nearly all major demographic groups, but it is up most sharply among women, adults ages 65 and older, and the less affluent.

** To account for inflation between 1989 and 2006, family income was divided into three roughly comparable groups.

PewResearchCenter

Casino Impact on the Local Community

Americans hold mixed views about whether casinos are good for their communities. A plurality (42%) say casinos have a negative impact on their communities, while a somewhat smaller number (34%) say they have a positive impact. The remainder either say they don't know or are ambivalent.

Those who report living near a casino are divided almost evenly over the impact of casinos (40% positive to 38% negative), though their views about casinos are more positive, on average, than are the views of people who don't have a casino in their area.

More positive still than the views of casino neighbors are the views of casino patrons. About half (52%) of casino-goers say the impact of casinos on the local community is positive, while 27% say it is negative.

PewResearchCenter

About the Pew Social Trends Reports

The Pew social trends reports explore the behaviors and attitudes of Americans in key realms of their lives – family, community, health, finance, work and leisure. Reports analyze changes over time in social behaviors and probe for differences and similarities between key sub-groups in the population.

The surveys are conducted by the Pew Research Center, a nonpartisan “fact tank” that provides information on the issues, attitudes and trends shaping America and the world.

Survey reports are the result of the collaborative effort of the social trends staff, which consists of:

Paul Taylor, Executive Vice President
Cary Funk, Senior Project Director
Peyton Craighill, Project Director

About the Survey

Results for this survey are based on telephone interviews conducted with a nationally representative sample of adults, ages 18 years and older, living in continental U.S. telephone households.

- Interviews conducted February 8 - March 7, 2006
- 2,250 interviews of which 1,473 were conducted with those who report gambling in the past year
- Margin of sampling error is plus or minus 2.5 percentage points for results based on the total sample at the 95% confidence level and 3 percentage points for results based on all gamblers. The margin of sampling error is higher for results based on subgroups of respondents.

Survey interviews conducted under the direction of Princeton Survey Research Associates International. Interviews were conducted in English and Spanish.

In addition to sampling error, bear in mind that question wording and practical difficulties in conducting surveys can introduce error or bias in the findings of opinion polls.
